

Bundesliga Brezn Make Football Matches More Memorable Between Friends

Robert Béres, Mihai Ciorascu

19 May 2026

Watching a live game with a friend is fun. Reacting to it together in real time is even better.

Bundesliga Brezn is a real-time multiplayer web app that turns passive match-watching into a shared, competitive experience between two fans. Fans have always watched matches together, but digital fan products treat each user in isolation. Bundesliga Brezn turns watching football into something you actually play.

Before kick-off, fans draft their starting lineup from the players available in that day's match — competing against a friend to build the best squad. The app encourages users to build mixed squads from both clubs, meaning no two lineups will ever look the same. As the game unfolds, your chosen players earn you points in real time: your striker scores, you climb the leaderboard — but if your goalkeeper concedes or one of your players is booked, you lose points too. Between the action, minigames keep the energy up — test your offside reflexes, answer trivia, or go head-to-head in a penalty shootout where one friend shoots and another defends.

The goal is simple: make every matchday feel like it was worth showing up for.

Frequently Asked Questions

Customer FAQs

Do I need an account to join a Bundesliga Brezn session?

Yes, you do need an account. Thankfully it is easy to create — just enter your email, pick a password, and confirm your address with the code you receive. You're in within minutes.

How many friends can I play with at once?

Currently Bundesliga Brezn supports 1v1 matches. Support for larger groups is planned as a future extension.

How does team drafting work?

Once you and your friend have created a party and both mark yourselves as ready, the draft begins. Each round presents both players with a choice between two players of identical or similar positions. If you and your opponent pick different players, each of you keeps their own. If you both pick the same player, a coinflip decides who gets them — the loser receives the player neither side chose.

After the draft, you select which players make your starting eleven — the app automatically identifies a valid real football formation and positions your players on the pitch accordingly, no manual arrangement needed. Once you lock in your squad, you must select a captain: your captain earns you double points for every event they are involved in. The app encourages building mixed squads from both clubs, ensuring every lineup is unique.

How do I earn points?

Points are earned on specific match events — your striker scores, your goalkeeper makes a save, one of your players wins a tackle. However, points can also be lost: if your goalkeeper concedes or one of your players receives a yellow card, your score takes a hit. Reaction events also appear on the right side of the screen during spectacular plays and nutmegs — react quickly enough and you earn bonus points.

What do I do with points?

Points can be used to purchase customisable music discs that play specific songs while you are in the app, or perks that give you an advantage over your opponent in future matches.

How do minigames work?

Minigames appear throughout the match to keep things competitive between events. There are three types:

- **Offside Reflex** — A player walks across the pitch and you must react the moment they cross the offside line. The faster your reaction, the more points you earn.
- **Penalty Shootout** — Two players from your party go head-to-head: one shoots, one defends. The striker picks a side to shoot, the goalkeeper picks a side to dive — if they differ, the striker scores; if they match, the keeper saves.

- **Trivia** — Football knowledge questions appear at regular intervals throughout the match. Answer correctly and quickly to earn bonus points.

What are badges and how do I earn them?

There are 31 badges split across 7 categories — things like scoring, defending, winning, and mini-game performance. Each badge has three tiers: bronze, silver, and gold. You earn them automatically when you hit certain milestones during a match, or you can buy them outright from the shop using brezn credits.

What are brezn credits?

Brezn is the in-app currency. You earn it by winning badges. You can spend it in the shop to buy badges you haven't unlocked yet, or music discs that play in the background while you use the app. Earning and buying costs the same per tier, so there's no grind.

Can I chat with my friend during the match?

Yes. There's an in-match chat that runs alongside the game. It's only active during the match and disappears when it ends, so it stays focused on what's happening on the pitch.

Technical & Internal FAQs

How does the app stay in sync during a live match?

WebSocket connections are used throughout the app whenever live updates need to happen. Persistent storage in the AWS cloud ensures that your data is not lost if you accidentally refresh the page or exit and return.

What happens if a user loses connection mid-game?

They can simply reconnect. All game state is persistently stored in DynamoDB, so nothing is lost if a player drops out and rejoins mid-match.

How are live events processed without race conditions or timing issues?

A fully cloud-native approach on AWS ensures events are handled in strict order. EventBridge feeds into an SQS FIFO queue, guaranteeing that match events are delivered and processed in exactly the sequence they occur — keeping every connected client's experience consistent and true to the live match.

Can the application handle sudden traffic spikes?

Yes. The entire solution is serverless, leveraging AWS Lambda, DynamoDB on-demand, S3, SQS, EventBridge and other managed services that scale automatically with demand.

How is artificial intelligence integrated into the app?

Bedrock acts as a match director throughout the game. It reads what's happening in real time and decides when to trigger mini-games and what commentary to show. As events unfold — a goal, a red card, a substitution — it produces a short natural-language comment that appears in the app, giving it a broadcast-style voice. If it tries to do something that

doesn't make sense for the current event, the app overrides it and falls back to a rule-based system, so a bad AI response can never break the experience.

How is the app deployed?

Almost everything deploys automatically. When code changes, GitHub Actions updates the relevant part of the AWS stack without anyone touching the console manually. All infrastructure is defined in CloudFormation, so the whole app can be redeployed from scratch at any time.
