

Bundesliga Brezn Make Football Matches More Memorable Between Friends

Robert Béres, Mihai Ciorascu

19 May 2026

Watching a live game with your friends is fun. Competing, predicting, and reacting to it together in real time is even better.

Bundesliga Brezn is a real-time multiplayer web app that turns passive match-watching into a shared, competitive experience for groups of friends. Fans have always watched matches together, but digital fan products treat each user in isolation. Bundesliga Brezn turns watching football into something you actually play.

Before kick-off, fans draft their starting lineup from the players available in that day's match — competing against friends to build the best squad. As the game unfolds, your chosen players earn you points in real time: your striker scores, you climb the leaderboard. Between the action, minigames keep the energy up — test your offside reflexes, answer trivia, or go head-to-head in a penalty shootout where one friend shoots and another defends. The goal is simple: make every matchday feel like it was worth showing up for.

Frequently Asked Questions

Customer FAQs

Do I need an account to join a Bundesliga Brezn session?

Yes, you do need an account. Thankfully it is easy to create, you just enter your email and pick a password, confirm your email by a code your receive, and you're in.

How many friends can I play with at once?

There is no restriction on the amount of friends you can play with.

How does team drafting work?

Once you and your friends have created a party and everyone marks themselves as ready, the draft begins. Each round presents all players with the same two choices: if you and a friend pick different players, each of you keeps your own. If you both pick the same player, a coinflip decides who gets them — the loser receives the player neither side chose.

After the draft, you arrange your squad on the pitch and choose who starts and who sits in reserve. Only active players earn you points. Your lineup can mix players from both teams — points are awarded whenever any of your picked players perform well in the real match.

How do I earn points?

Points are earned on specific events such as when one of your player scores a goal, your goalkeeper saves a goal, etc. You can also lose points in the case that one of your players earns a yellow card for example.

What do I do with points?

Points can be used to purchase custom music discs that play specific songs while you're in the app, or you can choose to purchase powerups that boost your points intake for specific events during your next game.

How do minigames work? Minigames appear throughout the match to keep things competitive between events. There are three types:

- **Offside Reflex** — A player walks across the pitch and you must react the moment they cross the offside line. The faster your reaction, the more points you earn.
- **Penalty Shootout** — Two players from your party go head-to-head: one shoots, one defends. The striker picks a side to shoot, the goalkeeper picks a side to dive — if they differ, the striker scores; if they match, the keeper saves. Roles then swap.
- **Trivia** — Football knowledge questions appear at regular intervals throughout the match. Answer correctly and quickly to earn bonus points.

Technical & Internal FAQs

How does the app stay in sync during a live match?

Websocket connections are leveraged all throughout the app, whenever live updates need to happen. Persistent storage in the AWS cloud ensures that your data is not lost if you accidentally refresh the page or exit the application and come back.

What happens if a user loses connection mid-game?

They can just reconnect. State is persistently stored in DynamoDB on AWS, no worries on losing connection.

How are live events processed without race conditions or timing issues?

A fully cloud-native approach on AWS ensures events are handled in strict order. Event-Bridge feeds into an SQS FIFO queue, guaranteeing that match events are delivered and processed in exactly the sequence they occur — keeping every connected client’s experience consistent and true to the live match.

Can the application handle sudden traffic spikes?

Yes. The entire solution adopted for Bundesliga Brezn is serverless, leveraging services such as AWS Lambda, AWS DynamoDB on-demand, S3, etc.

How is artificial intelligence integrated into the app?

AWS Bedrock is used to generate live match commentary throughout the game. As events unfold — a goal, a red card, a last-minute substitution — Bedrock interprets the event data and produces a short, natural-language comment that appears in the app, giving the experience a broadcast-style voice without requiring a human commentator. This keeps the atmosphere alive between minigames and reinforces the feeling that something is always happening.
